Livestock and Agriculture Implements in Household Operational Holdings, 1991-92

NATIONAL SAMPLE SURVEY ORGANISATION
DEPARTMENT OF STATISTICS
MINISTRY OF PLANNING & PROGRAMME IMPLEMENTATION
GOVERNMENT OF INDIA
October 1997
PREFACE

The National Sample Survey Organisation (NSSO) has been conducting nationwide surveys on Land and Livestock Holdings in the household sector on decennial basis. These surveys generate basic quantitative information on agrarian structure of the country, in terms of ownership as well as operation of land holdings. In addition, the surveys provide estimates on livestock holdings and ownership of agricultural machinery. The NSS 48th Round (January - December 1992) was devoted to the above subject.

The present report is the third in the series of four reports planned to be brought out on the survey results of 48th Round. The report provides salient features of livestock holdings and household ownership of agricultural machinery by size-class of operational land holdings for the agricultural year 1991-1992. It consists of three chapters and one appendix. Chapters one and two of the report give respectively introduction and brief note on sample design and estimation procedure adopted in the 48th Round. Chapter three deals with summary results of the present survey and their comparison with those of previous surveys.

The field work of the survey was done by the Field Operation Division, data processing and tabulation were undertaken respectively by the Data Processing Division and the Computer Centre. The Survey Design and Research Division had designed the survey and prepared the report.

I am thankful to the members of the Working Group for their valuable guidance at various stages of the survey activity -- from designing of the schedule of enquiry to the preparation of this report. I am grateful to the members of the Governing Council, Heads of the Divisions of NSSO, the Chief Executive Director of the Computer Centre and their colleagues for the efforts in bringing out this report. Despite delay in its release, the report, I am hopeful, can serve as a reference document to planners and policy makers.

(P. R. Dongre)

Highlights
[ refer only to rural India ]

Operating households
(i.e., households carrying out agricultural production)

The number of operating households has increased rapidly from 53 million in 1960-61 to 93 million in 1991-92.

The non-operating households constituted 20% of all rural households.

The average size of holding with an operating household, which was 2.52 hectares in 1960-61, has declined steadily during the last three decades. In 1991-92, the average was 1.34 hectares.

Households with marginal holdings (less than 1 ha.) constituted 48% of all rural households in 1991-92. The households with small holdings (1 to 2 ha.) accounted for another 14%. The marginal and small holdings together accounted for a third of the operated area in 1991-92.

Dairy Farming

During 1980s, there was a widespread growth of dairy farming in the country. The ratio of in-milk bovine stock to 100 households rose from 37 in 1981-82 to 46 in 1991-92. The ratio had fallen sharply (from 54 in 1971-72) during the preceding decade.

The rise in the ratio during 1980s was most pronounced in the states with a relatively high average in-milk stock, like Punjab, Haryana and Rajasthan. On the other hand, there was little improvement in the ratio in the states like Kerala, Orissa and Tamil Nadu.

The marginal and small holdings formed the core of the milk production sector. Together, they accounted for about 66% of the in-milk bovine stock in 1991-92.

(contd.)
Highlights
[ refer only to rural India ]

Poultry Farming

There has been a rapid growth in poultry farming during the 1970s and 1980s. The poultry stock per 100 households rose steadily from 101 in 1971-72 to 166 in 1991-92.

This growth was mainly caused by the rising poultry farming practice in the small and marginal holdings. In 1991-92, the marginal households (constituting 48% of all rural households) accounted for 55% of the poultry stock.

Ovine (sheep & goat)

The ratio of ovine stock to 100 households fell sharply from 105 in 1981-82 to 85 in 1991-92.

The fall was most pronounced in Rajasthan, whose share in the total ovine population was 23% in 1991-92. The ratio of ovine stock to 100 households in Rajasthan dropped from 449 in 1981-82 to 391 in 1991-92.

Mechanisation of agriculture

In 1991-92, there were 109 tractors per 10,000 hectares of operated area. The number was only 6 per 10,000 hectares in 1971-72.

The rapid rise in number of tractors was accompanied by a fall in the working bovine stock per 100 hectares of operated area -- from 65 in 1971-72 to 59 in 1991-92.

1.1 General

1.1.0 The survey on Land and Livestock Holdings carried out in the forty-eighth round (January-December 1992) of the National Sample Survey Organization (NSSO) is the fifth in the series of similar surveys conducted so far by the NSSO. The objective of these surveys has been to generate the basic quantitative information on the agrarian structure of the country, which is relevant to land policy. A large part of the information is collected mainly along the lines suggested in World Agricultural Census Programme of the Food and Agricultural Organisation (FAO) and thus serves the purpose of international comparison as well.

1.1.1 The present report is the third of the series of four reports to be brought out on the Land and Livestock Holdings survey. This report covers features of household operational holdings and presents estimates on ownership livestock and agricultural implements.

1.2 Background

1.2.0 The first survey on land holdings was taken up by the NSS in its eighth round (July ’54-April ‘55) as part of the World Agricultural Census initiated by the Food & Agricultural Organisation (FAO) of the United Nations. In this survey, information on (agricultural) holdings was collected mainly to meet the requirements of the FAO. In addition, information on household ownership holdings was collected to provide the policy framers with the much needed data for formulating land reforms policy for the country. A similar survey was conducted again in the sixteenth (July ’60 - August ‘61) and seventeenth (September ‘61 - July ’62) rounds of the NSS as a part of World Agricultural Census Programme of 1960.

1.2.1 Since then, NSSO has been regularly conducting Land Holdings survey after every ten years. The third Land Holdings survey of NSSO, conducted in its twenty-sixth round (July ’71 - June ’72), was integrated with a
survey on Debt and Investment at the instance of the Reserve Bank of India. The present enquiry, as well as the fourth survey of the series conducted in the thirty-seventh round (January-December '82), essentially repeated the twenty-sixth round survey with some modifications in item coverage and the method of data collection.

1.3 **Scope**

1.3.0 In the Land and Livestock Holdings survey of the NSSO, two types of holdings, namely, household ownership holdings and operational holdings, are enumerated by interviewing the sample households. Data are also collected on the livestock and agricultural implements of household operational holdings.

1.3.1 **Items of enquiry:** In the 48th round, information on various aspects of ownership and operational holdings was collected for both rural and urban areas. Particulars of land owned, land leased out, types and terms of lease formed the main body of information for the study of ownership holdings. Further, particulars of land leased in were also collected to ascertain the land possessed by the households. For the operational holdings, data on size, composition, tenurial form, land use, extent of irrigation by sources, fragmentation of holding, drainage facilities and other related aspects of holdings were collected. Since livestock and agricultural machinery form the basic resources for agricultural operations, an inventory of these assets owned by the households on the date of survey was also obtained.

1.3.2 **Geographical coverage:** The forty-eighth round was planned to cover the whole of Indian Union excepting

(i) Ladakh and Kargil districts of Jammu & Kashmir;

(ii) 768 interior villages of Nagaland (out of a total of 1119 villages) located beyond 5 kms. of a bus route;

(iii) 172 villages in Andaman & Nicobar Islands (out of a total of 520 villages) which are inaccessible throughout the year.

However, the survey could not be conducted in six districts of Jammu & Kashmir viz., Anantnag, Pulwana, Srinagar, Badgam, Baramula and Kupwara, and in the district of Amritsar in Punjab due to unfavourable field conditions.

1.4 **Method of Data Collection**

1.4.0. The information for Land and Livestock holdings survey was collected from a sample of households by interview method. Each sample household was visited twice during the period of survey with a gap of four to eight months. Two different schedules of enquiry were canvassed in the two visits.

1.4.1 **Survey period:** The survey period for the forty-eighth round survey was the calendar year 1992. In order to reduce recall error, particulars relating to the entire agricultural year were collected by visiting each sample household twice during the survey period. The first visits to the sample households were made
during January to August, while the second visits were made during September to December. The longer period for the first visit reflected the higher workload for the field staff during this visit compared to the second visit.

1.4.2 Reference period: The information on holdings operated during the *Kharif* season of the agricultural year 1991-92 was collected in first visit, while that on holdings operated during the *Rabi* season was collected in the second visit. In addition, particulars of operational holdings with the agricultural year 1991-92 as the reference period were also collected in the second visit. The present report is based on the data of household operational holdings with agricultural year as the reference period. However, the data on livestock and agricultural implements were collected during the first visit to the sample households.

1.4.3 Sample design: The sample design adopted for the survey was essentially a two stage stratified design, with census villages and urban blocks as first stage units (FSUs) for the rural and urban sectors respectively, and households as the second stage sampling units (SSUs) in both the sectors. The selection of villages was done with probability proportional to population (with replacement), mainly based on the 1981 census list of villages. The selection of urban blocks was done with equal probability without replacement based on Urban Frame Survey (UFS) conducted by the NSSO as an on-going activity. The details of sample design and estimation procedure adopted for the survey are given in Chapter 2 of this report.

1.4.4 Sample size - first stage units: In all 9052 villages were planned to be surveyed in this round. Of these, 4328 villages were allocated to the central sample - the part surveyed mainly by the NSSO field staff - and the rest to the state sample - the part surveyed by the state agencies. In the urban sector, the allocations for the central and state samples were 2484 and 3076 blocks respectively. This report is based on the estimates obtained from the central sample alone. The number of villages and urban blocks actually surveyed under the central sample was 4231 and 2420 respectively.

1.4.5 Sample size - second stage units: Our plan was to survey 8 households from each sample village and 9 households from each sample urban block. In the central sample, the actual number of households surveyed was 33289 in the rural sector and 20592 in the urban sector.

1.5 Concepts and definitions

1.5.0 Major concepts and definitions of important terms used in the survey and relevant to this report are explained below:

1.5.1 Household: A household is a group of persons normally living together and taking food from a common kitchen. However, a boarding house, a hotel or a hostel was treated as a cluster of households, where each individual boarder formed a separate household. If, however, some persons among them normally pooled their income for spending, the group was treated as forming a single household. Barracks of
military and paramilitary forces, orphanages and vagrant-houses were excluded from the scope of the survey.

1.5.2 Operational holdings: An operational holding is defined as a techno-economic unit wholly or partly for agricultural production (defined below) and operated (directed/managed) by one person alone or with the assistance of others, without regard to title, size or location. The holding might consist of one or more parcels of land provided they are located within the country and form part of the same technical unit. In the context of agricultural operations, a technical unit is a unit with more or less independent technical resources covering items like land, agricultural equipments and machinery, draught animals etc. Holdings used exclusively for livestock and poultry raising and for production of livestock and poultry products (primary) and/or pisciculture are considered as operational holdings whereas holdings put exclusively to uses other than agricultural production are not considered as operational holdings. Holdings operated by cooperative farms are also not considered as operational holdings.

1.5.3 Agricultural production: The extended definition of agricultural production, as adopted in the survey, includes growing of field crops, fruits, grapes, nuts, seeds, tree nurseries (except those of forest trees), bulbs, vegetables and flowers both in the open and in glass houses; production of coffee, tea, cocoa, rubber, forest production in parcels of land which form part of the enumeration holding and production of livestock and livestock products, poultry and poultry products, fish, honey, rabbits, fur-bearing animals, and silk-worm cocoons.

1.5.4 Individual and joint holdings: An operational holding managed by the members of a single household is taken as an individual holding and a holding managed by members of different households jointly is considered a joint holding.

1.5.5 Parcel: A parcel of an operational holding is a piece of land entirely surrounded by other operational holdings or by land not forming part of any operational holding. It might consist of one or more plots.

1.5.6 Ownership of land: (i) A plot of land was considered to be owned by a household if permanent heritable possession, with or without the right to transfer the title was vested in a member or members of the household. Land held in owner-like possession under long term lease or assignment was also considered as land owned. Thus, in determining the ownership of a plot of land two basic concepts were involved, namely,

(a) Land owned by the household, i.e. land on which the household had the right of permanent heritable possession with or without the right to transfer the title, e.g. Pattadars, Bhumidars, Jenmons, Bhumi-swamis, Rayat Sithibans, etc. A plot of land may be leased out to others by the owner without losing the right of permanent heritable possession.

(b) Land held under special conditions such that the holder did not possess
the title of ownership but the right for long term possession of the land (for example, land possessed under perpetual lease, hereditary tenure and long term lease for 30 years or more) was considered as being held under owner-like possession. In states where land reform legislation has provided for full proprietorship to erstwhile tenants, they were considered as having owner-like possession, even if they had not paid the full compensation.

(ii) Sometimes a plot may be possessed by a tribal in accordance with traditional tribal rights from local chieftains or village/district council. Again, a plot may be occupied by a tenant for which the right of ownership vests in the community. In both the cases, the tribal or other individual (tenant) was taken as owner, for in all such cases, the holder had the owner like possession of land in question.

1.5.7 Lease of land: (i) Land given to others on rent or free by owner of the land without surrendering the right of permanent heritable title is defined as land leased out. It is defined as land leased in if it is taken by a household on rent or free without any right of permanent or heritable possession. The lease contract may be written or oral.

(ii) Sometimes orchards and plantations are given to others for harvesting the produce for which the owner receives a payment in cash or kind. Such transactions were not treated as 'lease' for the purpose of the survey.

1.5.8 Otherwise possessed land: This was understood to mean all public or institutional land possessed by the household without title of ownership or occupancy right. The possession was without the consent of the owner. Private land (i.e. land owned by the household sector) possessed by a household without title of ownership and occupancy right was not included in this category. As in the 37th round survey, all private land encroached upon by the household was treated as leased-in land.

1.5.9 Homestead land: (i) Homestead of a household was defined as the dwelling house of the household together with the courtyard, compound, garden, out-house, place of worship, family graveyard, guest house, shop, workshop and offices for running household enterprises, tanks, wells, latrines, drains and boundary walls annexed to the dwelling house. All land coming under homestead was defined as homestead land.

(ii) Homestead may constitute only a part of a plot. Sometimes, gardens, orchards or plantations, though adjacent to the homestead and lying within the boundary walls, may be located on a clearly distinct piece of land. In such cases, land under garden, orchard or plantation was not considered as homestead land.
1.6 Contents of the Report

1.6.1 This report contains three chapters, including the present introductory chapter, and an appendix. Chapter 2 gives a fairly detailed description of the sample design and estimation procedure used for the survey. Chapter 3 discusses the principal survey findings on household operational holdings and the livestock and agricultural implements owned by the households. Appendix forms the main body of the report. It gives the results in detail for the household operational holdings.

1.6.2 The estimates presented in this report are based on the pooled data of the two sub-samples of only the central sample. In some of the tables of the Appendix, the sub-samplewise estimates are given for the basic characteristics.

1.6.3 The results presented in the report are mostly in the form of rates and ratios (like percentage, average etc.). The basic aggregate estimates for the number of household operational holdings and area operated, provided in Table (1R) and (1U) of the Appendix, may be used for arriving at aggregate estimates of other characteristics.
Chapter 2
Sample Design and Estimation Procedure

2.1 Sample Design

2.1.0 A stratified two-stage sampling design was adopted for the survey with the first stage units as census villages for rural areas and the Urban Frame Survey blocks for urban areas. Households formed the second stage units in both rural and urban areas.

2.1.1 Sampling frame for first stage units (FSU’s): In the rural sector, the sampling frame in most of the strata was the 1981 census list of villages. However, in Assam, where the 1981 census was not undertaken, and in a few districts of other states, where the available list as per 1981 census was incomplete, the 1971 census list of villages was used. In the urban sector, the sampling frames used in most cases were the lists of NSS Urban Frame Survey (UFS) blocks. However, the 1991 census house listing enumeration blocks were considered as the sampling units for some of the new towns declared as urban areas in the 1991 population census.

2.1.2 Stratification: Each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the India as whole was 78.

2.1.3 In the rural sector, within each region, each district with a rural population of less than 1.8 million according to the 1981 census formed a single basic stratum. Districts with larger population were divided into two or more strata, depending on population, by grouping contiguous tehsils, similar as far as possible in respect of rural population density and crop pattern. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million. Further, in Assam, the strata formed for the earlier NSS rounds on the basis of 1971 census rural population exactly in the above manner, but with a cut-off point of 1.5 million population, were retained as the strata for rural sampling.

2.1.4 In the urban sector strata were formed, again within NSS regions, on the basis of 1981 (1991 in some of the new towns) census population of towns. Each city with a population 10 lakhs or more formed a
separate stratum by itself. The remaining towns of each region were grouped to form three different strata on the basis of 1981 (1991 in a few cases) census population. The strata were formed as details stated below:

Composition of Urban Strata:

<table>
<thead>
<tr>
<th>stratum no.</th>
<th>population size class of towns</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>all towns with population less than 50,000</td>
</tr>
<tr>
<td>2</td>
<td>all towns with population 50,000 to 1,99,999</td>
</tr>
<tr>
<td>3</td>
<td>all towns with population 2,00,000 to 9,99,999</td>
</tr>
<tr>
<td>4</td>
<td>all towns with population 1 million and above</td>
</tr>
</tbody>
</table>

2.1.5 Allocation of sample: A total all-India sample of 6812 first stage units (4328 villages and 2484 urban blocks) - determined on the basis of investigator strength in different states/u.t.'s and the expected workload per investigator - was initially allocated to the states/u.t.'s in proportion to central field staff available. The sample thus obtained for each state/u.t. was then allocated to its rural and urban sectors considering the relative sizes of the rural and urban population with almost double weightage being given for the urban sector. Within each sector of state/u.t., the allotted sample size was re-allocated to the different strata in proportion to the stratum population. All allocations were adjusted so that the sample size for a stratum was at least a multiple of 4 for the rural and urban sectors separately. This was done to accomplish equal-sized samples in each sub-sample and sub-round. The only exception was Daman & Diu for which the first stage rural sample comprised 2 villages only.

2.1.6 Selection of first stage units: The selection of sample villages was PPS (with replacement) with population as the size variable, in the form of two independent sub-samples. The sample blocks were selected by simple random sampling without replacement, also in the form of two independent sub-samples.

2.1.7 Arunachal Pradesh: For the rural areas of Arunachal Pradesh, a cluster sampling procedure was followed. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages, each cluster being formed around a nucleus village, according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.1.8 Selection of hamlet-groups / sub-blocks: Large villages and blocks were divided into a suitable number of hamlet-groups and sub-blocks respectively having more or less equal population content. Two hamlet-groups were then selected from large villages, whereas only one sub-block was selected from the large blocks. The hamlet-groups were selected circular systematically and the sub-block with equal probability.

2.1.9 Selection of households: Two different procedures of selection of households were used for the rural and
2.1.10 In the rural sector, eight households were selected from each sample village/selected hamlet groups. For selecting a sample of 8 households, first, all the households of the sample village or selected hamlet groups were divided into four sub-strata by area of land possessed by them. Households possessing either no land or land less than .005 acre were grouped in sub-stratum 1. The rest of the households were then arranged in ascending order by area of land possessed and classified into three sub-strata, 2, 3 and 4, such that the total area of land possessed by the households in each of the 3 sub-strata was nearly the same. Independent samples of size 1,3,2 and 2 households were selected circular systematically from the sub-strata 1, 2, 3 and 4 respectively.

2.1.11 In the urban sector, a sample of 9 households were selected from each sample urban block/sub-block. The households of a sample block/sub-block were classified into 7 strata, considering the monthly per capita consumption expenditure (mpce) and indebtedness status of the households. For this, the households were first grouped in three mpce classes, viz., less than A, A to B and B & above. The cut-off points A and B were determined at the state-level on the basis of mpce obtained from the survey on consumer expenditure, NSS 43rd Round, such that the mpce classes, below A, A to B, and B and above, respectively constituted 30 p.c, 60 p.c, and 10 p.c. of the urban population of the state. These mpce classes were further sub-divided by indebtedness status of the households to form 7 sub-strata. A sample of size 1 or 2 was selected from each sub-strata. For the sub-strata with allocation of 2 sample households, the samples were drawn circular systematically.

2.1.12 Sample size : In all, the survey covered 53881 households spread over 6651 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households surveyed, are given for different state/u.t.'s and all-India in the statement given below, separately for rural and urban sectors.
2.2 ESTIMATION PROCEDURE

2.2.0 The estimation procedure adopted in the 48th round for schedule 18.1 is briefly indicated here.

2.2.1 Notations: The notations used for describing the estimation procedure are given below:

- $s$: subscript for $s^{th}$ stratum
- $i$: subscript for $i^{th}$ village/block
- $t$: subscript for $t^{th}$ sub-stratum (i.e. household-strata within a village/block)
- $j$: subscript for $j^{th}$ sample household
- $L$: total number of rural/urban strata in the state
- $p$: village population (used for sampling and as per frame)
- $P$: total population of a rural stratum (as per frame)
- $N$: total number of blocks in an urban stratum as per frame. This notation is also used for total number of villages in a rural stratum of Arunachal Pradesh as per frame
- $n$: number surveyed villages/blocks including depopulated and zero cases available for tabulation (excluding casualty and other not received cases)
- $C$: number of census villages in a surveyed revenue village
- $D$: number of hamlet-groups/sub-blocks formed
- $H$: total number of households in the frame
- $h$: number of surveyed households (available for tabulation) in a sub-stratum
- $x$, $y$: values of characteristics
- $X$ or $Y$: total of $x$ or $y$ at the state level
- $\hat{Y}$: estimate of $Y$ from the sample for rural sector
- $D' = D$ if $D=1$
- $=D/2$ if $D \geq 4$

2.2.2 Estimates of aggregates: As sampling procedures were different for the rural and the urban sectors, the estimation formulae used for the two sectors was also different.

2.2.3 Rural: For the states and u.t.s, other than Arunachal Pradesh and Lakshadweep, the estimates for the aggregate for the $s^{th}$ stratum is given by

$$\hat{Y}_s = \frac{P_s}{n_s} \sum_{i=1}^{n_s} D'_s \frac{1}{C_s} \sum_{r=1}^{4} H_{s;i} \sum_{j=1}^{h_{s;i}} y_{s;ij}$$

For Arunachal Pradesh,

$$\hat{Y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} \sum_{t=1}^{4} \sum_{j=1}^{h_{s;i}} H_{s;i} y_{s;ij}$$

and for Lakshadweep,

$$\hat{Y}_s = \frac{7}{n_s} \sum_{i=1}^{n_s} D'_s \frac{1}{C_s} \sum_{j=1}^{h_{s;i}} H_{s;i} y_{s;ij}$$
2.2.4 Urban: For all the states, the estimate of aggregate of the $s^{th}$ stratum is given by

$$\hat{Y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_i \sum_{t=1}^{T} \sum_{j=1}^{H_{sit}} s_{sitj}$$

2.2.5 State/u.t. level estimates: The aggregate estimates at the state/u.t. levels were worked out separately for the rural and urban sectors. For both the sectors, the aggregate estimate at the state/u.t. level was obtained as

$$\hat{Y} = \sum_{s=1}^{L} \hat{Y}_s$$

2.2.6 Subsample estimates: Each subsample estimate was based on the data collected from the surveyed FSUs of the respective subsample. For each state/u.t. (or national level estimate) 2 subsample estimates were obtained separately for the rural and urban sectors. The formulae given above were used for this purpose, taking $n_s$ as the number of surveyed FSUs of the respective subsample.

2.2.7 Combined estimate: The ‘combined’ estimates for the rural urban sectors of a state/u.t. (or national level estimate) were obtained as the simple averages of the subsamplewise estimates for the respective sectors. All the estimates presented in this report are based on the combined estimates of the aggregates, unless otherwise specified.

2.2.8 Estimates of ratios: Let $X$ and $Y$ be the respective totals of two characteristics $\bar{x}$ and $\bar{y}$ at the state/u.t./national level. Thus the estimate of ratio $R = \frac{Y}{X}$ is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where $\hat{X}$ and $\hat{Y}$ are the estimates of $X$ and $Y$ respectively. Both the subsample and the combined estimates of ratios were obtained in this way.
3.0.1 The Land and Livestock Holdings survey (LHS) of NSSO is one of the main sources of information on livestock and poultry held by the household sector of the economy. It also provides estimates of two basic distributions of land holdings, viz. distribution of land owned by households and that of agriculturally operated land. Information on ownership of land and on operation of land was presented respectively in the first and second reports on Land and Livestock Holdings Survey of the 48th round (NSS Report Nos. 399 & 407). The present report gives the survey results relating to ownership of agricultural implements, livestock and poultry classified by operated area of the household operational holdings.

3.0.2 The major findings of the enquiry on ownership of livestock and agricultural machinery are summarised in this chapter. To start with, the discussion briefly traces the changing aspects of household operational holdings and their size-distribution over the last three decades. The size and composition of livestock and poultry holdings of the households are then presented in some detail. Finally, the survey results indicating the extent of mechanisation of agriculture are discussed in terms of ownership of draught animals and selected items of agricultural machinery and equipment.

HOUSEHOLD OPERATIONAL HOLDINGS

3.1.1 A household operational holding includes all the operational holdings directed or managed by the members of the household. (For definition of an operational holding, see para 1.5.2). A household operational holding covers all the individual operational holdings in their entirety and those parts of the jointly (with other households) operated holdings which are considered to be the share of the household.

3.1.2 As distinct from a household ownership holding, which is restricted to the area of land under the household's ownership, a household operational holding encompasses all land under physical possession of the household either owned, leased in or otherwise possessed. A household with the entire land and other assets for agricultural production under its possession was considered a household operational holding provided some agricultural production was carried out on any part of the land during the reference period. (For definition of agricultural production, see para 1.5.3). For the present survey, the agricultural year 1991-92 was used as the reference period. Households undertaking no agricultural production during the reference period are referred to as households operating no land or non-
operating households. In all the tables, given in the Appendix, such households are included in the “nil” size class of household operational holdings.

3.1.3 The area possessed by a household in its operational holding (henceforth, called holding) is called operated area of the holding. For the present survey, the area possessed by a holding for the major part of the agricultural year 1991-92 was taken as its operated area.

3.2 Estimates of household operational holdings: all-India

3.2.1 Number of operating households: Table 1 gives survey estimates of the number of holdings and area operated separately for rural and urban areas of the country. It is seen that of the 158 million households of the country¹, about 103.5 million operated some land during the agricultural year 1991-92. That means about 66% of the households of the country were engaged in agricultural production.

3.2.2 Average holding size: The average size of a land holding operated by a rural household² was 1.08 hectares and that by an urban household was 0.23 hectare. Considering that 80% of the rural households were engaged in agricultural production in 1991-92, the average size of holding of a rural operating household (excluding the non-operating households) was 1.34 hectares.

3.2.3 The remaining part of the discussion relating to household operational holdings deals with the rural sector only.

3.3 Trends in household operational holdings

3.3.1 Data on household operational holdings are collected regularly by the NSSO since its eighth round (1954-55). So far, five land holding surveys, including the present one, have been conducted. The results of these surveys form a useful series of data spanning a long period of time. The estimates of different rounds are on the whole comparable, except for those of the 8th round, which, due to differences in

¹ The number of households enumerated by the 1991 Census (with a reference date of March 01, 1991) was 152.1 million (111.6 and 40.4 million in rural urban areas respectively). Source: Census of India 1991. Series 1. India. Paper 2 of 1992. Final

² Note that the number of households is same as the number of household operational holdings, including the “nil” class.
definitions, are not strictly comparable with subsequent rounds and are therefore omitted from the discussion which follows.

3.3.2 A brief discussion on definitions of operational holding adopted in different LHSs of NSSO is given in NSSO Report No. 407 (para 3.2.2 and 3.2.3). Here, it may be reiterated that there is a problem of comparison between the estimates of LHS of the 37th round (1981-82) and those of the other LHSs of NSSO. The estimates of the 37th round were generated only from the data collected for the major crop season. In contrast, the estimates of the other rounds (17th, 26th and 48th) were obtained directly from the data collected for the entire agricultural year. On this count, the estimates of operating households and operating area of the 37th round are probably low in comparison with those of the other LHSs. The estimates of absolute number of livestock and agricultural implements, however, are not expected to be seriously affected by this.

3.3.3 Table 2 gives the basic estimates relating to household operational holdings of the last four LHSs of NSSO. The table

Sources of estimates of 17th, 26th and 37th rounds: NSS Report Nos. 144, 215 and 338
also provides the sample sizes (at both stages) on which the estimates are based.

3.3.4 Growing number of operating households: According to NSS estimate, the number of operating households has increased rapidly from 53 million in 1960-61 to 93 million in 1991-92. The growing pressure of population on land and inadequate non-farm employment opportunities have led to continuing subdivision of household land holdings.

3.3.5 Rise in the proportion of operating households: During the twenty years since 1960-61, there had been no significant change in the percentage of operating households. The present survey suggest that this percentage rose sharply during the 1980s from 74% in 1981-82 to 80% in 1991-92.

3.3.6 As is evident from the estimated percentages of operating households and land-owning households (items 3 & 4 of Table 2), the number of operating households has always been substantially smaller than the land-owning households. The results of the present survey, however, suggest a tendency of narrowing of the gap between the number of land-owning households and operating households (Figure 1).

3.3.7 Change in area operated: The total operated area of 133 mha. in 1960-61 had dropped to 126 mha. in 1971-72 - a fall of about 8%. The estimates of the 26th round and the present survey (125 mha.) reveal little change in operated area during the last two decades. In comparison, the estimate of the 37th round is significantly low. This was more due to the reference period used for estimation of area in the 37th round than an actual change in area operated. Bearing this in mind, it can be reasonably concluded that total operated area in the rural sector has remained largely unchanged during the 1970s and 1980s.

3.3.8 Declining size of household operational holdings: The effect of rapidly growing number of households with a limited land base is clearly shown by the estimates of average operated area. Over the last three decades, area operated per household and per operating household have declined substantially. During the last decade, however, the area operated per operating household has declined at a faster pace than the area operated per household (Figure 2).

3.3.9 Mechanisation of agriculture: The estimates of number of working bovine (i.e. working cattle plus working buffalo) per 100 hectares of operated area and number of tractors per 10,000 hectares of operated area are given in Table 2. It is seen that there were only 6 tractors per 10,000 hectares in 1971-72. During the last two
Livestock and Agricultural Implements

Chapter 3

Summary of Findings

decades, the number of tractors has grown to 109 per 10,000 hectares in 1991-92. The rapidly rising tractor to land ratio was accompanied by a declining number of draught animals to land ratio throughout this period. The number of working bovines per 100 hectares of operated area declined from 65 in 1971-72 to 62 in 1981-82, and further to 59 in 1991-92.

3.4 Size distribution of household operational holdings: all-India

3.4.1 Changes in agrarian structure are reflected in the size distribution of land holdings. Changes in various aspects of size distribution of household operational holdings are, therefore, of considerable interest. In the detailed tables given in the Appendix, two different size classifications have been presented -- one based on 16 size classes and the other on 9 broader classes. The latter are referred to as "broad size classes" and the former as simply "size classes".

These size groups will henceforth be called categories of household operational holdings.

3.4.3 Growth of marginal holdings: Land holdings distribution is characterised by predominance of marginal holdings. Table 3 reveals that, during the period 1960-61 to 1991-92, percentage of households in the combined group of ‘nil’ and marginal categories of household operational holdings has risen from 58% to 70%. There has, however, been a fall in the percentage of households in the 'nil' category since 1971-72, particularly during the 1980s. In general, there has been a progressively downward shift in the distribution of household operational holdings. The percentages of large, medium and semi-medium holdings have been declining steadily since 1960-61. The decline is steepest for the large holdings from 3% to 1%.

3.4.4 Number of household operational holdings: The growing pressure of population on land and consequent subdivision of holdings is clearly reflected in the changes in the absolute numbers of household operational holdings in different size classes. Figure 3 shows the trends in number of household operational holdings in different categories during the period 1960-61 to 1991-92. It is seen that over the three decades the numbers of household operational holdings in different categories have not changed at the same rate. The number of households in the 'nil' category have grown from 19 million in 1960-61 to 25 million in 1991-92. During the same time, the number of marginal holdings have grown two and a half times -- from 22 million to 56 million. The number of small holdings, too, has been increasing, though at a slower pace. As against this, the absolute numbers of large and medium holdings have declined steadily during this period.
3.4.5 Distribution of operated area: Table 4 gives percentage distributions of operated area by category of household operational holdings from the last four LHSs of NSSO. It is seen that the share of marginal holdings in total operated area has increased from 7% in 1960-61 to 16% in 1991-92. The share of small holdings, too, has grown substantially. Taken together, the marginal and small holdings accounted for a third of the operated area in 1991-92. At the other end, one sees a significant decline in the share of large holdings -- from 28% in 1971-72 to 15% in 1991-92.

3.5 Ownership and operation of land

3.5.1 In Table (2R) of the Appendix, the percentage distributions of household operational holdings by size-class of holdings is presented. Table 5 gives the percentage distribution of households by household operational holding for each broad size-class of household ownership holding.

Source of estimates of percentage distribution of households by household ownership holdings is NSS Report No. 399.
operational holdings are given for each broad size-class of household ownership holdings. The percentage distributions at the national level are summarised in Table 5.

3.5.2 In this table, the percentage of households belonging to the same broad size class of ownership and operational holdings are shown under “same class”. The percentage of households operating no land or land less than 0.002 ha. are classified as “not operating”. The households with operational holdings of size-class higher than that of its ownership holding are accounted for in “higher class” and the rest of the households shown under “lower class”.

3.5.3 The difference between the sizes of ownership holding and operational holding of a household results mainly from leasing of land. Possession of public or institutional land without title of ownership or occupancy right also contributes towards the difference, but to a much smaller extent. It is seen from Table 5 that significant proportions (11% to 15%) of marginal land owners operated larger area of land and there was largely an inverse relationship between size of ownership holding and proportion of households with an operational holding of “higher class”.

LIVESTOCK HOLDINGS

3.6.1 In recent years, there has been renewed emphasis on promotion of diversified agricultural growth for income augmentation and employment generation\(^3\). Animal husbandry and poultry farming are expected to play an important role in supplementing the limited income and employment opportunities in crop-production sub-sector of agriculture, particularly for the small and marginal holdings. This section deals with the trends in livestock and poultry holdings households in different categories of household operational holdings.

3.6.2 To begin with, a comparison of the estimates of livestock and poultry populations based on the LHSs of NSSO may help in understanding the general nature of changes underway in the animal husbandry sub-sector of agriculture. Table 6 gives the estimated number (rural+urban) of principal kinds of livestock and poultry in India according to the last three LHSs of NSSO. It may be noted that the estimates of ovine stock, number of pigs and poultry are not available from the LHS of 1960-61. For each of the three LHSs for which NSS estimates are given, estimates from the nearest livestock census are shown in the table. As the estimates of livestock census 1992 are not yet available, those of the 1987 Census are given below the NSS estimates of the 48th round.

Note: 1. Figures in parentheses placed below the NSS 26th, 37th, 48th round figures are based on livestock censuses of 1972, 1982 and 1987 respectively.
2. ‘R’, ‘U’ and ‘T’ respectively stand for ‘rural’, ‘urban’ and ‘total’.

3.6.3 Changes in number of livestock and poultry: First, Table 6 reveals a most unmistakable rapid expansion of poultry farming during the period 1971-72 to 1991-92. The poultry population of 84 million in 1971-72 has grown over two and a half times during this period and stood at 226 million in 1991-92. Secondly, there has been a general rise in bovine population during the two decades. The ovine population (sheep and goat) had risen from 80 millions 1971-72 to 103 millions in 1981-82, but then remained more or less stable (111 millions in 1991-92). The rise in buffalo population, too, has been gradual from 51 millions at the beginning to 73 millions at the end of the period. For cattle, the rise has, apparently, been less smooth. There was a fall (from 175 million to 169 million) during the first of the two decades and a more than compensating rise in the following decade. This feature of changing cattle population is discussed in some more detail in the next paragraph.

3.6.4 Changing composition of cattle population: While collecting particulars of livestock holdings, the cattle and buffaloes owned by a sample household were classified according to their sex, age and use. The adult (more than 28 months if crossbred cattle, more than 3 years otherwise) male population were classified into three classes viz. ‘for breeding only’, ‘for work only’, ‘for breeding and work both’ and ‘others’. The adult female population, on the other hand, was classified according to their lactation potentials. Among the cattle and buffaloes, those which were in milk on the date of survey were counted in the in-milk class. Those which had calved at least once and were not in milk on the date of survey but had the potential of coming in milk in the future were counted as dry. The combined class of in-milk and dry cattle and buffaloes is called the milch animals. The rest of the adult female cattle and buffaloes were grouped in the others class. Table 7 gives the estimated number of working and in-milk cattle in rural India according to the last three LHSs of NSSO.

3.6.5 As noted earlier, during the 1970s and 1980s, there was a fairly extensive growth of mechanisation in agriculture, which reduced the importance of bullock
power in crop cultivation and other allied activities. This is reflected in the fall in the stock of *working* cattle from 73 millions in 1971-72 to 66 millions in 1981-82 in the rural areas (Table 7). With the falling requirement of bullock power in cultivation, it appears likely that cattle-rearing had slackened during this decade. As a result, the number of *in-milk* cattle, too, declined from 27 millions in 1971-72 to 19 millions in 1981-82. By this time, the campaigns for operation flood were well underway. The following decade saw a substantial expansion in the coverage of the campaigns. Besides, there was a growing demand for milk in the agriculturally advanced states like Punjab and Haryana. The consequent growth of dairy farming during the 1980s brought about an increase in the cattle population, with a shift in its composition towards *in-milk* cattle and away from *working* cattle by 1992.

### 3.7 Livestock and size of holding

#### 3.7.1 Mixed farming is a traditional practice in Indian agriculture. In particular, symbiotic operations of crop production and animal husbandry, especially dairy farming, have been practised widely in the past. The scales of operations carried out on a farm being closely related to the size of holdings, it is likely that the latter would have some bearing on the size of livestock reared on it. The recent changes in association between the size of holding and the number of different types of livestock and poultry are discussed in the following paragraphs.

#### 3.7.2 Changes in *in-milk* bovine stock:
The bovine population has a two-fold utility in non-mechanised farming. The male population serves as draught animals which are primarily used for crop cultivation and secondarily for transportation and other activities. The female population, besides being essential for breeding, is the major source of milk supply. The number of *milch* cattle and buffaloes held by a household, therefore, represents the dairy-farming component of the livestock holding. But, as the estimates for *dry* cattle and buffaloes are not available from the 26th round, the estimates of *in-milk* stock are used for studying the changes in the dairy farming activity. Tables 8 gives the estimates of *in-milk* bovine stock per 100 households by category of household operational holdings of the last three LHSs of NSSO.

---

5 Note that a major share of milk production in the country comes from the bovine stock. In 1991-92, bovine milk constituted about 96% of the total milk production. Source: ibid
3.7.3 It is seen from Table 8 that the all-categories ratio of *in-milk* bovine stock to 100 households fell sharply from 54 in 1971-72 to 37 in 1981-82. This fall was partly recovered by a rise in the next decade and the ratio was estimated at 46 in 1991-92.

3.7.4 A general feature that clearly emerges from Table 8 is a strong positive association between *in-milk* bovine stock and size of household operational holdings. The larger sized holdings, endowed with greater resources for fodder supply, investments and human labour time, could naturally maintain a larger bovine stock. The landless, marginal and small holdings, on the other hand, with their limited resources, had fewer *in-milk* cattle and buffaloes on an average.

![Figure 4](image)
3.7.5 The positive relationship, which still prevails between the size of holding and in-milk bovine stock, has, however, gradually weakened during the two decades since 1971-72. It is seen from Table 8 that the ratio of in-milk bovine stock to 100 households in the marginal, small and semi-medium categories, in each decade, moved in the same direction as the all-categories ratio. The ratio for the medium and large holdings, on the other hand, declined progressively during this period. For the "nil" category, too, there was a continuous decline during this period.

3.7.6 Rising share of marginal category in dairy farming: Figure 4 shows the percentage shares of size categories of household operational holdings in the total in-milk bovine population. It is seen that the marginal and small categories form the core of the milk production sector. Taken together, they accounted for about 66% of the in-milk bovine stock in 1991-92. It is also seen that there was a sharp increase in the percentage share of the marginal category in the in-milk bovine population. This percentage increased steadily from 20% in 1971-72 to 44% in 1991-92.6

3.7.7 In dairy farming activity, buffaloes yield higher returns as compared to the cattle stock. Table 9 gives the percentage of in-milk stock separately for cattle and buffalo populations, as estimated from the last three LHSs of NSSO. It is seen that buffaloes have been used mainly for milk production. The in-milk stock accounted for a substantially higher proportion of the buffaloes than of the cattle population.

3.7.8 Increasing use of buffaloes in dairy farming: The number of in-milk stock per

---

6 This agrees closely with the estimate of a study on “Operational Flood Milkseds” conducted by NCEAR in 1988-89. According to the study the marginal and small farmers and landless together accounted for 62-64% of the milch stock.
100 households by category of household operational holdings is given separately for cattle and buffalo in Tables 10 and 11 respectively. These two tables bring out the growing use of buffaloes in dairy farming, especially in the holdings of higher size-categories. Besides the rise in the percentage of buffaloes in the in-milk bovine stock since 1970-71 (see Table 9), the pattern and composition of in-milk

3.7.9 Change in Ovine holding: Table 12 gives the number of ovine (sheep and goat) held by different size-categories of holdings for 1971-72, 1981-82 and 1991-92. Like the in-milk bovine stock, the ratio of ovine stock per 100 households shows an increase with the size of holding. There was, however, a high fluctuation in the overall ratio during the two decades. It

bovine stock across the size-categories of holdings have undergone a considerable change. In the marginal, small and semi-medium categories, the number of in-milk cattle per 100 households was more than in-milk buffaloes throughout the two decades. The medium and large holdings, on the other hand, have shown a clear preference for buffaloes in dairy farming. In these two size-categories, while the number of in-milk cattle per 100 households has declined in both the decades, the number of in-milk buffaloes per 100 households, after having fallen during 1970s, has grown substantially during 1980s.
by the 'nil' category), too, ovine stock per 100 households has declined steadily during the two decades. In spite of the low requirements of fodder and other inputs, ovine farming in the small and marginal holdings has not only failed to grow in keeping with the rising need for diversification, but has, in fact, shrunk considerably during the 1980s.

3.7.10 Pigs: Traditionally, piggery has been an occupation of the scheduled tribes and other economically backward households. The estimates of pigs per 100 households by size-category of holdings are given in Table 13. In 1971-72, the activity of pig rearing was more prevalent in the lower categories. Estimates indicate that over the two decades, particularly during the 1980s, the practice of pig rearing is beginning to grow among the larger holdings. On the other hand, there are signs of decline in pig rearing by the marginal and small holders. In the "nil" category, too, the number of pigs per 100 households fell perceptibly during the 1970s.

3.7.11 Rapid growth in poultry farming: It was noted earlier (para 3.6.3) that there has been a rapid growth in poultry farming during 1971-72 to 1991-92. It is seen from Table 14 that the growth was mainly brought about by the rise in poultry stock in the marginal, small and semi-medium holdings. There was a steady rise in poultry stock per 100 households for all the three size-categories of holdings during the two decades. On the other hand, there was a sharp decline in the poultry to household ratio in the large and medium size-categories during the 1980s, after a rise in the 1970s.
3.7.12 The estimates for 1971-72 show little variation in poultry stock per 100 households across the size-categories, indicating largely an equitable distribution of the poultry stock. During the two following decades, the distribution of poultry underwent a substantial change. So much so that, in 1991-92, poultry stock per household was much higher in each of the marginal to semi-medium categories than in the large and medium ones.

3.7.13 The rising share of marginal holdings in poultry farming: The percentage shares of size-categories in total poultry are shown in Figure 5 for 1971-72, 1981-82 and 1991-92. It is seen that the marginal category -- constituting 48% of the households -- accounted for 55% of the poultry stock in 1991-92. In 1971-72, its share in poultry stock was 33% -- same as the percentage it constituted in the total households.

3.8 Changes in Livestock Holdings: Inter-state comparison

3.8.1 Table 15 gives the number of poultry and selected types of livestock per 100 households in 15 major states for 1991-92, 1981-82 and 1971-72, as obtained from the LHSs of NSS 48th, 37th and 26th rounds respectively. The most noticeable feature is that the pace of growth in the animal husbandry sub-sector has varied widely across the states.

3.8.2 In-milk bovine stock: The estimates of in-milk bovine stock per 100 households, given in Table 15, represent the dairy-farming component of the bovine population in the household sector. These reveal a disparate pattern of growth of dairy farming in different states.

3.8.3 The average in-milk bovine stock of a household has undergone a substantial change in all the major states during 1971-72 to 1991-92. During the 1970s, there was a fall in the average in all these states, except Punjab & Kerala. Earlier, (in para 3.6.4 & 3.6.5) it has been mentioned that there is a close link between in-milk bovine stock, especially cattle, and the use of animal power in cultivation. It will be seen that, with the growing mechanisation in agriculture, there has been a fall in the working bovine stock per holding in all the major states during 1970s and 1980s (see Table 20). Thus, the decline in average in-milk bovine stock in most of the major states during the 1970s appears to be closely related to the process of mechanisation. Punjab presents an interesting case in this respect. The changes in the in-milk cattle stock of Punjab are discussed in some detail later (para 3.8.5).

Sources of estimates of 26th & 37th rounds:
NSS Report Nos. 215 & 338
During the following period of 1981-82 to 1991-92, there was a widespread growth of dairy farming in the country. Most of the major states witnessed a rise in the average in-milk bovine stock during this period. The rise was most pronounced in the states with relatively high average, like Punjab, Haryana and Rajasthan. But there was little or no improvement in the average in-milk bovine stock in the states like Kerala, Orissa and Tamil Nadu. As a consequence of these disparate patterns of growth, the inter-state variation in the average in-milk bovine stock has widened during the 1980s.

3.8.5 Rising in-milk bovine stock in Punjab: It is interesting to note that though there was a rapid progress of mechanisation in agriculture and consequent fall in the working bovine stock in Punjab during the 1970s, the in-milk bovine stock per 100 households did not show any sign of decline. On the contrary, in-milk bovine

</table>
stock per 100 households rose from 85 to 90 during 1971-72 to 1981-82. Table 16 shows the changes in size and composition of in-milk bovine stock per 100 households for Punjab, Haryana and Uttar Pradesh. These are the only three states where the number of buffaloes exceeds that of cattle in the in-milk bovine stock. It is seen that, as in other states, the number of in-milk cattle per 100 households did decline during the 1970s in Punjab as well. The rise in the average in-milk bovine stock in this state is due to a progressive growth in the average number of in-milk buffaloes and cross-bred cattle during the 1970s and 1980s.

3.8.6 Average ovine holding: Table 15 also gives the changes in ovine holding per 100 households. It is seen that the average ovine stock varies considerably across the major states. The average ovine stock in Rajasthan has always been much higher than in other states. In 1991-92, while the average for Rajasthan was as high as 391, for all the other major states, it was less than the national level average of 85. In fact, the share of Rajasthan in the total ovine population of rural India works out to be about 23%.

3.8.7 In contrast, estimates of the present survey reveal that the average ovine stock was as low as 10 per 100 households in Punjab. It was also low in Kerala(20) and Haryana(25).

3.8.8 The average ovine holding of the major states has changed considerably during the last two decades. It has declined substantially in the states like Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Maharashtra and Rajasthan, where the average was more than the national average in 1971-72. In Rajasthan, the ovine holding per 100 households dropped from 504 in 1971-72 to 449 in 1981-82, and then to 391 in 1991-92. Among remaining states, the fall in the average was most pronounced in Gujarat. In Uttar Pradesh, on the other hand, the average ovine holding rose perceptibly during both the decades.

3.8.9 It may be of significance to note that the states of Eastern region, viz. Assam, Bihar, Orissa and West Bengal, there was a substantial rise in the average ovine holding during the 1970s, but it was followed by a fall in the next decade. Interestingly, a similar trend was also observed in Punjab and Haryana -- the two agriculturally most developed states of the country. However, the fall during the 1980s was much sharper in these two states than the states of the Eastern region.

3.8.10 Poultry holding per 100 households: The average size of poultry per 100 households in the 15 major states is given in Table 15. The general feature emerging from the table is that the distribution of poultry has continued to remain unevenly spread across the major states.

3.8.11 Among the major states, poultry farming has been mostly concentrated in Assam, Kerala, West Bengal and Orissa. In 1991-92, there were 669 poultry per 100 households in Assam. In the other three states, the number varied from 396 in Kerala to 218 in Orissa. In contrast, each of the other major states, except Maharashtra, had an average holding less than the national level average of 166. The estimates indicate that poultry farming was carried out scarcely in Punjab, Haryana, Rajasthan and Uttar Pradesh.

3.8.12 During the last two decades, there has been a rapid growth of poultry farming in the country, but it has remained mostly confined to a few states with high
prevalence of the activity. In Punjab and Haryana, however, there was a significant rise in the average poultry holding during the 1970s, which subsequently fell below the initial level by 1991-92. In Andhra Pradesh and Tamil Nadu, too, there had been an appreciable growth in poultry farming in the 1970s but it was not sustained during the following decade.

3.8.13 Number of pigs per 100 households: Table 15 also shows the changes in number of pigs per 100 households during 1971-72 to 1991-92 for the 15 major states. The number of pigs per 100 holdings shows some variation over the major states. In general, pig farming is not a widely practised activity. In 1991-92, on an average there were only 4 pigs for every 100 households in the rural areas. Only in Assam, it was found to be a practice of noticeable significance. In this state, the average number of pigs was 18 per 100 households in 1991-92.

MECHANISATION OF AGRICULTURE

3.9.1 The process of mechanisation of agriculture in India can be said to have began with the introduction of HYV seeds by the Government in the 1960s. Since then it has progressed at a fairly rapid pace covering a large part of the country. This sub-section traces the development of mechanised cultivation in terms of use of modern machinery such as tractors, pumps and power tillers, and its effects on the means of traditional cultivation, such as ploughs and draught animals.

Sources of estimates of 26th & 37th rounds: NSS Report Nos. 215 & 338

3.9.2 During the 1970s and 1980s, Indian agriculture witnessed a rapid rise in use the of modern farm equipment. Table 17 shows that, in 1971-72, there were barely 75 thousand tractors in the country. By 1981-82, the number rose to half a million, and in 1991-92 the number of tractors was estimated at 1.4 millions. Besides, the number of power-tillers and pumps has also increased. In 1971-72, about 5 million pumps were in use for agriculture. Each of the following decades saw an addition of 5 million.

3.9.3 The rapid rise in the number of tractors during the 1970s was accompanied by a fall in the working bovine stock from 81 million in 1971-72 to 73 million in 1981-82. The estimates given in the table, there was no change in the working bovine stock in the following decade, even though the number of tractors rose by about a million. It is further noted that the number of ploughs did not decline during this period, but rose perceptibly in the 1980s.
3.10 Mechanisation and size of holding

3.10.1 As the capital resources required for mechanisation of agriculture could be raised only by the larger farmers, the process was initially confined mostly to the large and medium holdings. But, its impact is evident on the ownership of draught animals across all the size-categories of holdings from the changing pattern of ownership of working bovine stock. The changes in the number of tractors and the number of working bovine stock per 10,000 ha. of operated area in different size-categories are discussed in the following paragraphs.

3.10.2 Changing pattern of tractor ownership: Table 18 shows the changing pattern of ownership of tractors per 10,000 hectares for 1971-72, 1981-82 and 1991-92. It is seen that the overall ratio rose from a meagre 6 in 1971-72 to 109 in 1991-92. In 1971-72, the large and medium holdings had 12 and 7 tractors per 10,000 hectares of operated area respectively, while the other three size-categories had negligibly few. By 1981-82, even the marginal and small holdings were reported to have some tractors, clearly indicating that the tractor-services were being bought and sold. Since then hiring out of tractor as an occupation of the marginal and small holders, at least at the subsidiary level, has grown appreciably. In 1991-92, there were respectively 41 and 78 tractors per 10,000 hectares of operated area of the marginal and small holdings.
3.10.3 Evidently, there is a positive relationship between the number of tractors per 10,000 ha. of operated area and the size of holding. But during the two decades, the ratio has grown at a faster pace in the smaller holdings than in the larger ones. As a result, the increase in the ratio with size of holding is becoming less steep over time.

3.10.4 Changes in the average working bovine stock: Unlike the tractor to operated area ratio, working bovine stock per 100 hectares decreases as the holding size increases. Table 19 reveals that this decline is getting progressively steeper over time.

3.10.5 The all-categories ratio between the working bovine stock and operated area has been declining steadily since 1971-72. This trend is observed for all the size-categories of holdings, except the marginal category. For the marginal holdings the ratio rose during the 1980s, after having fallen during the 1970s. Over the two decades, the decline in the ratio has been the steepest among the large holdings -- from 21 to 5. For the medium category, too, there was a substantial fall in the ratio.

3.10.6 Clearly, the increasing use of tractors for cultivation has brought about this decline in the ratio of stock of draught animals to operated area for the large holdings. For the marginal and small holdings, too, the decline over the two decades appears to have been indirectly caused by the same phenomenon. In the pre-mechanisation period, a large part of the animal labour requirement of the large and medium farmers was met by the marginal and small holdings. With the reduction in the demand for animal labour in the large and medium holdings, the working bovine stock per 100 hectares has tended to decline to some extent in the small and marginal holdings as well.

3.10.7 Figure 6 shows the changes in

![Figure 6](image_url)
working bovine stock per 100 households for each size-category of holdings. Since 1971-72, there has been a general decline in the average working bovine stock of all the size-categories of holdings. Though the average bovine stock has remained largely unchanged during the 1980s for marginal holdings, it has declined steadily for all other categories since 1971-72, and dropped sharply during the 1980s for large and medium holdings. As a result, the relationship between working bovine stock and size of holding is seen to have undergone a change: average working bovine stock no longer increases with size of holding as it did in 1971-72 and 1981-82.

3.11 Mechanisation of Agriculture: inter-state comparison

3.11.1 Table 20 gives the number of selected farm equipments and working bovine stock per 100 hectares of operated land in 15 major states for 1991-92, 1981-82 and 1971-72, as obtained from the LHSs of NSS 48th, 37th and 26th rounds respectively. The following are the points of interest.

(a) Mechanisation of agriculture has progressed at disparate rates in different states of the country. In 1991-92, the states with the highest three tractor to operated area ratios were Punjab (1024), Haryana (387) and Uttar Pradesh (215). In all the other states, the ratio was less than the national average of 109.

(b) These three states were among the four with the highest number of power-tillers per 10,000 hectares in 1991-92. The other state with the number of power-tillers per 10,000 hectares higher than the national level was West Bengal.

(c) At the national level, the working bovine stock per 100 hectares fell with the rise in tractor to operated area ratio during the two decades. This feature is common to most of the states. However, Bihar stands out as a glaring exception, in which both the ratios have been rising steadily since 1971-72. Haryana and Gujarat are the other two states, where the number of working bovines per 100 hectare rose during the 1970s, despite a rise in the number of tractors per 10,000 ha. of area.

(d) During the two decades, there has been a steady rise in the number of pumps per 100 hectares of operated area in all the states. In 1991-92, the three states with highest number of pumps per 100 hectares were Punjab (42), Kerala(32) and Tamil Nadu (32). At the other end, there were insignificantly few pumps per 100 hectares in Assam (1) and Orissa (2).
### Table 20

Changes in numbers of tractors & power-tillers per 10,000 hectares of operated area and number of pumps & working bovine stock per 100 hectares of operated area in 15 major states
